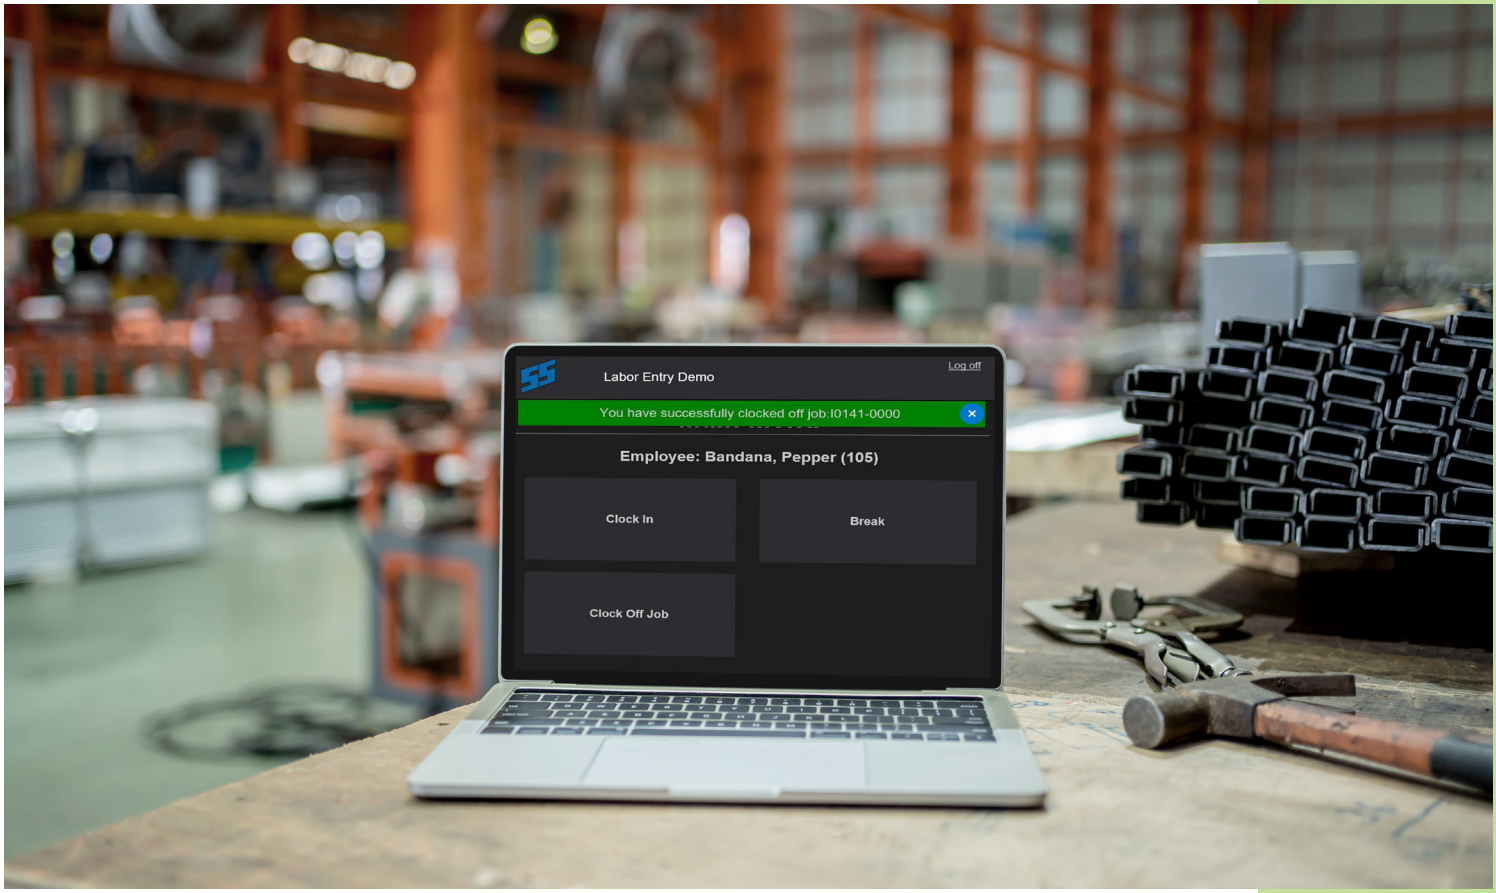
Labor Entry Software for M2M



What is Labor Entry software?

Labor Entry enables you to quickly clock-in or clock-out of a job and have labor posted to M2M.

The software runs on IIS, which can be anywhere on your local network.

Labor Entry can run in a browser and works with barcode scanners connected to a computer or tablet.

Why Use Labor Entry?

Employees can record how long it takes to complete a job, who was on the job, and if there were breaks taken. Data (like the Employee ID, Job, and Quantity) can be scanned using the existing barcodes. The labor information is collected in your M2M, associated with the appropriate job, and is available for reporting.
